## Comparing GUI & CLI

From my understanding a GUI (Graphical User Interface) is the interface the viewer sees whether that's going onto google, steam, reddit or anything else where you are interacting with Graphic images. If I am correct, even typing this quick essay on docs is still a GUI but when it comes to text itself I'd say that's an element within the interface because it's not necessarily a graphic image.

When it comes to CLI (Command Line Interface) I immediately think of something like the matrix where you start unraveling that visual layer to see a new interface that appears to be a text box where you can type special commands that will send signals from inside the computer. This is what I would consider the heart of the computer or the operating system. I will also say at least for now that this to me is like discovering a wall in a cave with some kind of ancient text written all over it but eventually I hope to uncover these mysteries.
