Learning Styles

When it comes to learning strategies there are so many ways to retain information whether it's Flashcards, Note Taking, Verbal Reminders, Quizzes, games, you name it it's out there. My guess is there's probably someone out there who learns better by playing an educational game on the topics they're learning about then there may be someone who can only learn through flashcards. I personally can only retain information like a specific subject if I go through all the course material right away. I get overwhelmed if I jump back and forth between subjects. For school in general I signed up for different learning tools to help me throughout the semester and yet I have used none of them. From me when it comes to retaining information I think I don't remember anything and then I quickly realize most of the time there will be much more than I thought I could retain. I tend to use many different things depending on who I'm feeling or what the subject is. If I need to retain information that is more visual I will take many visual notes with images. I keep everything on a particular website where you can save links , notes, pictures, voice memos etc. Then I can even access all of it on my phone as well. Everything is broken down into specific folders so I don't get overwhelmed too much. Personally when it comes to the Coding game where you have to make the dude run around and think about angles my brain just doesn't work that way but we'll figure it out I hope. Main take away is that there's no wrong or right way to retain information. If the information manages to stay in your brain it's a good day.
